1 DATA DESCRIPTION

1.1 Parameters

This data set contains a bed topography and bathymetry map of Greenland based on mass conservation and ocean bathymetry data from multiple sources.

1.2 File Information

1.2.1 Format

The data are provided as a single netCDF (.nc) file. The bed elevation parameter (see section 1.2.2) is also provided as a geoTIFF file (.tif).

NetCDF comprises a set of machine-independent data formats and software libraries that can be used to create, share, and access scientific data sets. NetCDF is developed and maintained by Unidata, a University Corporation for Atmospheric Research (UCAR)'s Community Program. For more information, visit the Unidata Network Common Data Form (NetCDF) website.

GeoTIFF is an image format that contains embedded georeferencing information for use in GIS applications. For more information, visit the Open Geospatial Consortium website.

1.2.2 File Contents

All parameters of the data set are detailed in Table 1.

<table>

### 1.2.3 Naming Convention

The netCDF data file is named as follows:

```
BedMachineGreenland-v5.nc
```

where "v5" refers to the version of the data set. The geoTIFF file has the same name but with "_bed" appended:

```
BedMachineGreenland-v5_bed.tif
```

### 1.2.4 Final Map Images

Figure 1 illustrates Greenland bed topography (m) with respect to mean sea level (left) and ice thickness (m) (right).
1.3 Spatial Information

1.3.1 Coverage

Spatial coverage for this data set includes Greenland and the Arctic.

Southernmost Latitude: 60° N
Northernmost Latitude: 90° N
Westernmost Longitude: 80° W
Easternmost Longitude: 10° E

1.3.2 Resolution

The output product is generated at a 150 m resolution. The true resolution varies between 150 m and 5 km.
1.3.3 Geolocation

The following table provides information for geolocating this data set.

| Table 2. Geolocation Details |
|-------------------------------|-----------------|
| **Geographic coordinate system** | WGS 84 |
| **Projected coordinate system** | WGS 84 / NSIDC Sea Ice Polar Stereographic North |
| **Longitude of true origin** | -45° E |
| **Latitude of true origin** | 70° N |
| **Scale factor at longitude of true origin** | 1 |
| **Datum** | WGS 84 |
| **Ellipsoid/spheroid** | WGS 84 |
| **Units** | meters |
| **False easting** | 0 |
| **False northing** | 0 |
| **EPSG code** | 3413 |
| **PROJ4 string** | +proj=stere +lat_0=90 +lat_ts=70 +lon_0=-45 +k=1 +x_0=0 +y_0=0 +datum=WGS84 +units=m +no_defs |
| **Reference** | https://epsg.io/3413 |

1.4 Temporal Information

1.4.1 Coverage

The data were collected between 01 January 1993 and 31 December 2021. The nominal year of this data set is 2007.

1.4.2 Resolution

Not specified
2 DATA ACQUISITION AND PROCESSING

2.1 Background

Bed topography and seafloor bathymetry regulate ice dynamics and water flow around Greenland, which impact glacier undercutting, calving, and movement. High-resolution mapping of subglacial features can improve understanding of ice-ocean interactions and ice sheet changes.

Bed topography and ice thickness data are primarily collected by airborne radar sounders; however, the data quality is insufficient along coastal margins. Using multiple data sources and methods, along with the radar-derived ice thickness, optimizes mapping to provide a comprehensive bed topography and fjord bathymetry map of Greenland.

2.2 Acquisition

Source data used in deriving this product are listed below.

Ice thickness data

- Operation IceBridge radar-derived thickness data, posted at 30–60 m, with a vertical precision of 30 m, collected by the MCoRDS radar ([IceBridge MCoRDS L2 Ice Thickness](#))
- Ice thickness data from the Doppler focused radar of the Technical University of Denmark (DTU) for the region of 79 North (Thomsen et al., 1997; Christensen et al., 2000) and Russell (Lindbäck et al., 2014)
- Ice thickness data from the High CApability Radar Sounder (HiCARS; Peters et al., 2005; Peters et al., 2007) operated by the University of Texas, Institute for Geophysics
- Ice thickness data from the Pathfinder Advanced Radar Ice Sounder (PARIS; Raney, 2010)
- Ice thickness data from the Alfred Wegener Institute (AWI; Nixdorf et al., 1999)
- Ice thickness data from Uppsala University (UU; Lindbäck et al., 2014), collected in the vicinity of Russell Gletscher
- Ice thickness for ice caps from Millan et al. (2022)

Sounding data

- Multibeam echo sounding data from Oceans Melting Greenland (OMG 2016, 2017, and 2020 Missions) along the coast of West and Southeast Greenland

Bathymetry data

- Bathymetry data from Oceans Melting Greenland (OMG 2021 Mission)
- Bathymetry data from Slabon et al. (2016) along the Northwest coast
- Bathymetry data from Weinrebe et al. (2009) in Torssukataq and Uummannaq Fjords
- Bathymetry data from O’Cofaigh et al. (2013) in Uummannaq Fjord
- Bathymetry data from Dowdeswell et al. (2014), Rignot et al. (2015), Fried et al. (2015), and Rignot et al. (2016) in Uummannaq Fjord
Bathymetry data from Schumann et al. (2012), Holland et al. (2008) and Straneo et al. (2012) in Ilulissat Icefjord

Bathymetry data from Mix et al. (2015) in front of Petermann Fjord and the adjacent Hall Basin

Bathymetry data from Sutherland et al. (2014) near Kangerdlussuaq

Bathymetry data from Dowdeswell et al. (2016) in Nordvestfjord

Bathymetry data from Chauché et al. (2014) near Lille Gletscher

Bathymetry data from Straneo et al. (2016) in Sermilik fjord

Bathymetry data from Motyka et al. (2017) in Godthåbsfjord

Bathymetry data from Stevens et al. (2016) in Sarqardleq fjord

Bathymetry data from Kjeldsen et al. (2017) in Timmiarmiut Fjord, Heimdal Glacier and Skjoldungen Fjord

Bathymetry data from Rysgaard et al. (2003) in Young Sound fjord

Bathymetry data from Bendtsen et al. (2017) near Flade Isblink Ice Cap

Single beam bathymetry data from Sutherland and Pickart (2008) on the continental shelf along the Southeast coast

Single beam data from Olex and crowd sourced data from fishing and recreational vessels (MaxSea)

Bathymetry data from An et al. (2019) along the Northwest Greenland coast

Bathymetry data from Millan et al. (2018) and An et al. (2019) in Southeast Greenland

Bathymetry data from An et al. (2021) in Northeast Greenland

Bathymetry data from the Alfred Wegener Institute, Helmholtz Centre for Polar and Marine Research, in front of the Northeast Ice Stream

Radar data

Ice velocity measurements derived from satellite radar data collected during 2008–2009, posted at 150 m, with errors of 10 m yr$^{-1}$ in speed and 1.5° in flow direction (Mouginot et al., 2017):

- Japanese Advanced Land Observing System (ALOS) PALSAR
- Canadian RADARSAT-1 SAR
- German TerraSAR-X
- European Envisat Advanced SAR (ASAR)

Radar data from Hiawatha thickness (Kjaer et al., 2018)

Radar data from the Programme for Monitoring of the Greenland Ice Sheet (PROMICE) (Søren et al., 2019)

Radar data from East Greenland Ice Core Project (EGRIP) thickness (Franke et al., 2020)

Radar data from Northeast Greenland Ice Stream (NEGIS) thickness (Jansen et al., 2020)

Ancillary products used include:

- Surface Mass Balance (SMB) averaged for the years 1961 to 1990 downscaled to 1 km with a precision between 7 percent and 20 percent in the ablation zone (Noël et al., 2016; data set available from the authors upon request)
• Ice thickening rates from altimetry data differencing between the years 2003 and 2006 (Khan et al., 2014)
• Surface elevation from the Greenland Mapping Project (GIMP) Digital Elevation Model (Howat et al., 2014)
• Ice and Ocean mask from the Greenland Mapping Project (GIMP) Digital Elevation Model (Howat et al., 2014)
• RTopo-2 (Schaffer et al., 2016)

2.3 Processing

Sparse, airborne radar-sounding-derived ice thickness data are combined with comprehensive, high-resolution ice motion derived from satellite interferometric synthetic aperture radar to calculate ice thickness based on mass conservation. The mass conservation method solves the mass conservation equation to derive ice thickness while minimizing the departure from the original radar-derived ice thickness data. Ice surface motion provides a physical basis for extrapolating sparse ice thickness data to larger areas with few or no data. The method works best in areas of fast flow, where errors in the flow direction are small and glaciers slide on the bed. In the interior regions, where errors in the flow direction are larger, kriging is used to interpolate ice thickness for the 1993–2016 data (Morlighem et al., 2014). Beginning with the 2017 data, streamline diffusion was used in the interior regions instead of kriging.

Ocean bathymetry is mapped by combining sparse bathymetry measurements from single and multibeam measurements and casts and RTopo-2 (Schaffer et al., 2016).

The algorithm neglects ice motion by internal shear, which is an excellent approximation for fast-flowing glaciers (>100 m yr⁻¹) (Morlighem et al., 2014).

The bed topography is derived by subtracting the ice thickness from the Greenland Mapping Project (GIMP) Digital Elevation Model.

2.4 Quality, Errors, and Limitations

Sources of error include error in ice velocity direction and magnitude, error in surface mass balance, and ice thinning rates. In a trial setting with unusually dense radar sounding coverage, errors in the mass-conservation-inferred thickness were 36 m, only slightly higher than that of the original data. In areas less well constrained by radar-derived thickness data or constrained by only one track of data, for example, in south Greenland, errors may exceed 50 m (Morlighem et al., 2013).

No or very little data were available for some fjords, and uncertainty may be high (>500 m).
An error estimate of the bed elevation and ice thickness is provided in the data set, illustrated in Figure 2.

Figure 2. Error Estimate of Greenland Bed Elevation and Ice Thickness

2.5 Instrumentation

2.5.1 Description

The Center for Remote Sensing of Ice Sheets (CReSIS) Multichannel Coherent Radar Depth Sounder (MCoRDS) operates over a 180 to 210 MHz frequency range with multiple receivers developed for airborne sounding and imaging of ice sheets. See IceBridge MCoRDS L2 Ice Thickness, Version 1 for further information on the MCoRDS radar and the Level-2 data.
3 SOFTWARE AND TOOLS

The netCDF data file is compatible with HDF5 libraries and can be read by HDF readers such as HDFView, a visual interface for viewing the file hierarchy, modifying the contents of a data set, and creating new files. The file can also be opened and plotted with the Panoply data viewer.

GeoTIFF files can be viewed with a variety of GIS software packages, including QGIS and ArcGIS.

4 VERSION HISTORY

Table 3. Version History Summary

<table>
<thead>
<tr>
<th>Version</th>
<th>Release Date</th>
<th>Description of Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>V1</td>
<td>13 January 2015</td>
<td>Initial release</td>
</tr>
<tr>
<td>V2</td>
<td>19 May 2015</td>
<td>Version 2 improved processing of some basins and added Operation IceBridge 2014 data. Heights were provided with respect to mean sea level, instead of the WGS84 ellipsoid. The geoid was included in an additional field in the data.</td>
</tr>
<tr>
<td>V3</td>
<td>25 September 2017</td>
<td>Version 3 added ocean bathymetry all around Greenland based on data from NASA’s Ocean Melting Greenland (OMG) and other campaigns of bathymetry measurements. The subglacial bed topography was also updated by including more ice thickness data and constraining the ice thickness at the ice/ocean interface based on bathymetry data when available.</td>
</tr>
<tr>
<td>V4</td>
<td>13 May 2021</td>
<td>Version 4 incorporated updated radar data to better constrain the ice thickness inland. Multibeam data for ocean bathymetry were updated to include data from 2017 and 2020 OMG campaigns. Bathymetry data were added from new gravity inversions. The format of surface, bed, and thickness was changed to “single”. Streamline diffusion was implemented in the interior regions instead of kriging beginning January 2017.</td>
</tr>
<tr>
<td>V5</td>
<td>06 September 2022</td>
<td>Version 5 added bathymetry measurements from the Alfred Wegener Institute, Helmholtz Centre for Polar and Marine Research, in front of the Northeast Ice Stream, ice thickness for ice caps from Millan et al. (2022), and bathymetry data from the 2021 OMG campaign. A geoTIFF file of bed elevation was also added.</td>
</tr>
</tbody>
</table>

6 RELATED WEBSITES

Ice Future Research Group, Department of Earth Sciences, Dartmouth College

7 CONTACTS AND ACKNOWLEDGMENTS

7.1 Investigators

Mathieu Morlighem
Department of Earth Sciences
Dartmouth College
Hanover, NH 03755 USA

7.2 Acknowledgments

Versions 1 to 4 of this data set were funded by the NASA Cryospheric Sciences Program (#NNX15AD55G) and the National Science Foundation’s ARCSS program (#1504230), in cooperation with the University of Bristol as part of the Basal Properties of Greenland project (NERC grant NE/M000869/1).

Version 5 was funded by the NASA Studies With ICESat-2 program (#NNH20ZDA001N-ICESAT2) and Heising Simons Foundation grants (2019-1161 and 2021-3059).

We would like to thank Greenland Ice Sheet Ocean Research Coordination Network (GRISO RCN) for their help in finding available bathymetry data.
